## Statement of compliance with academic ethics and the avoidance of plagiarism

I honestly declare that this dissertation is entirely my own work and none of its part has been copied from printed or electronic sources, translated from foreign sources and reproduced from essays of other researchers or students. Wherever I have been based on ideas or other people texts I clearly declare it through the good use of references following academic ethics.

(In the case that is proved that part of the essay does not constitute an original work, but a copy of an already published essay or from another source, the student will be expelled permanently from the program).

Name and Surname (Capital letters): AADHITHYA ROY PAYAROLI

Date: 21 – February – 2026

# 1. PROJECT GOAL

The goal of this project is to study how Artificial Intelligence (AI) spreads in different countries and how it links to funding and government readiness. The project uses three data sources that cover different parts of the AI system. Eurostat shows the percentage of enterprises that use AI, and this study focuses on enterprises with 10 or more employees. OECD.AI shows VC investment in AI by country and year. Oxford Insights gives the Government AI Readiness Index for 2023, it covers various metrics but this work uses only the overall score to show public sector preparation.

With these sources, the project answers five questions. First, which countries have the most enterprise AI use in 2025, and the journey of each country by year. Second, which countries get the most AI VC investment, and if this investment stays steady or changes a lot over time. Third, how government preparation varies across countries in 2023, and if places with strong preparation also have high use. Fourth, for 2023, if there is a clear link between use and VC investment at the country level. Fifth, to help with decisions, the project creates a country ranking that combines use, preparation, and investment into one score. It also groups countries based on levels of use and preparation.

The final set of Tableau worksheets and dashboards helps to compare EU and selected European countries that seem set to expand AI use or that require help to boost their use.

# 2. LITERATURE REVIEW

AI adoption gets measured as the share of firms that use at least one AI technology. This measure works because it allows comparison across countries and over time (Calvino et al., 2018). It differ by firm size, sector, and digital maturity (Zolas et al., 2020). Some firms face barriers like cost, skill gaps, and lack of data (Zolas et al., 2020). Large firms adopt sooner as they have bigger IT budgets and more use cases. Adoption measures depend on definitions. Surveys count different tools as AI, and the same tool gets used in various ways (Calvino et al., 2018).

VC investment acts as a sign of innovation and interest in AI business (Babina et al., 2023). A high investment could mean a high startups, procutds and an indication of demand for business (Babina et al., 2023). But just because of high investment, it doesn't mean all the enterprises or firms adopting it already. There is usually a delay between the actual usage and availability of the funds (Babina et al., 2023). Some investments go to research or platform work, which may not appear in adoption rates in the same year (Cockburn et al., 2019). Investment data varies across countries. A few big deals can alter totals a lot. This causes year-to-year changes to swing (Babina et al., 2023). For analysis, view investment as a trend and compare it with measures like adoption and readiness.

This is where government readiness indexes are a good indicators to try to show that if a country has suffiecient means to support AI use in public services. These indexes cover so many things like govt support, policy strength, infrastructure, access, skills, and innovation of envirnment. E ven though a high readiness means better adoption, it doesn't guarentee high enterprise adoption (Wirtz et al., 2019). Firms rely on business value, cost, and internal ability. Readiness measures aid benchmarking and talks, but they are combined scores. They rely on how indicators get chosen and weighted (Greco et al., 2019). Use them as comparison signs, not as final proof of government work (Greco et al., 2019). In order to be useful in decision making it is better to combine indicators for the analysis (Greco et al., 2019). It will also help explain why one country performs better than the other and also rank them properly. For combined score, we have to select weights and thresholds (Greco et al., 2019). In this project, the dashboards use this multi-indicator method. They give separate views for adoption, investment, and readiness, and then mix them for a 2023 prioritisation view.

# 3. DATASET OVERVIEW

This project uses three datasets. Each dataset covers a different part of the AI trends. The files connected to Tableau before it gets cleaned by Excel.

1) Eurostat — AI use in enterprises (AI adoption)

- Clean file: eurostat_ai_adoption_clean.xlsx
- What it measures: the share of enterprises that use at least one AI technology.
- Size: "10 persons employed or more".
- Activity scope in the file: All activities (except agriculture, forestry and fishing, and mining and quarrying), without financial sector.
- Time coverage: 2021, 2023, 2024, 2025 (no 2022).
- Geography coverage: 34 country codes, including EU27 and several non-EU European countries.
- Grain (one row means): Country × Year.
- Main fields:
  - Country_Label, Country, Year
  - AI_Adoption_Rate (percentage)
  - context fields: Size_Class, Activity, Unit

2) OECD.AI — VC investments in AI (AI investment)

- Raw format: separate Excel files per country, with industry-level rows.
- Clean file: oecd_ai_vc_investment_clean.xlsx
- What it measures: country-level VC investment in AI (USD Millions).
- Time coverage: 2012 to 2025.
- Geography coverage: 31 country codes, including EU27.
- Grain: Country × Year after aggregation.
- Main fields:
  - Country_label, Country, Year
  - AI_VC_Investment (total investment for that country-year)

- ➢ Industries (count of industries contributing in that country-year)

3) Oxford Insights — Government AI Readiness Index (2023)

- Clean file: oxford_ai_readiness_2023_clean.xlsx
- What it measures: a country's AI readiness score for government use of AI (overall score only).
- Time coverage: 2023 only.
- Geography coverage: 193 countries.
- Grain: Country (single year).
- Main fields:
- ➢ Rank, Country_Label, Country, Year
- ➢ AI_Readiness_Score

# 4. DATA PREPARATION

All preparation was done in Excel. The aim was to convert each source into a clean, flat table with consistent keys so Tableau relationships work without errors. Final outputs were saved as cleaned Excel files.

1) Eurostat — AI adoption in enterprises

Raw issues

- Export had extra header rows, notes, and mixed layout.
- Year values were spread across columns (wide format).
- Multiple size classes were available, but the project required one consistent scope.

Steps done in Excel

- Opened the raw export and removed non-data rows (titles, footnotes, metadata).
- Kept only the scope "10 persons employed or more" (total enterprises with 10+ employees).
- Fixed ordering and alignment of rows/columns so each country matched the correct year values.
- Converted the dataset from wide to long format (unpivot years):
  - Created a single Year column and a single AI_Adoption_Rate column.
- Standardised column names and kept only fields needed for Tableau:
  - Country_Label, Country, Year, AI_Adoption_Rate
  - plus context fields like Size_Class, Activity, Unit (kept for filters/notes).
- Cleaned data types:
  - ensured adoption values are numeric (percentage)
  - ensured Year is numeric.

Output

- Saved as: eurostat_ai_adoption_clean.xlsx

2) OECD.AI — VC investments in AI

Raw issues

- Data came as separate files per country.
- Rows were at industry level, so totals were not ready for dashboard use.

Steps done in Excel

- Imported all country files into one combined table.
- Checked column consistency across files (same headers and units).
- Built a country-year summary using pivot tables / aggregation:
  - AI_VC_Investment = SUM of investment values for each Country × Year
  - Industries = COUNT DISTINCT of Industry per Country × Year
- Standardised identifiers:
  - added or confirmed Country_label (3-letter code) and Country name.
- Cleaned data types:
  - ensured investment is numeric
  - ensured Year is numeric.

Output

- Saved as: oecd_ai_vc_investment_clean.xlsx

3) Oxford Insights — Government AI Readiness Index

Raw issues

- Report extract contains many columns (pillars, dimensions, indicators).
- Project required only one readiness measure for comparison.

Steps done in Excel

- Kept only the overall readiness score and rank from the 2023 index.
- Removed other pillar/dimension columns to keep the table simple.
- Added fields needed for Tableau relationships:
  - Country_Label (3-letter code)
  - Year = 2023

- Cleaned data types:
  - rank and score converted to numeric.

Output

- Saved as: oxford_ai_readiness_2023_clean.xlsx

Final preparation outcome for Tableau

- All three cleaned tables use a consistent join key:
  - Country_Label and Year
- This allowed Tableau to relate sources at country-year level, and build 2023 comparison views without manual blending.

Tableau Data Model Connection

Relationships used:

- Eurostat ↔ Oxford (Readiness)
  - Match keys: Country_Label and Year
- Eurostat ↔ OECD (Investment)
  - Match keys: Country_Label and Year

# 5. KEY CALCULATED FIELDS AND PARAMETERS

A) Calculated fields

The field named AI Adoption Rate (0-1) uses the formula AI Adoption Rate (0-1) equals AI_Adoption_Rate divided by 100. The field named Latest Adoption per Country (LOD) gives the adoption value for the most recent year. This field helps with ranking top or bottom countries and with filters. These fields fix the value at the country level. This way, the same number shows in all charts. Adoption 2023 (Country) is the average adoption for 2023. Also like that, Investment 2023 (Country) and Readiness 2023 (Country) is the total VC investment and readiness score for 2023. To combine different metrics, each one ist changes to a scale from 0 to 1 with the min-max method. The formula is Norm equals (Value minus Min) divided by (Max minus Min). This applies to adoption, readiness, and investment. Countries go into groups based on two thresholds.

If adoption is at or above the adoption threshold and readiness is at or above the readiness threshold, the group is Scale Now. If adoption is below the adoption threshold and readiness is at or above the readiness threshold, the group is Build Demand. If adoption is at or above the adoption threshold and readiness is below the readiness threshold, the group is De-risk First. In other cases, the group is Monitor. One score comes from weights. The formula is Priority Score = (wA*Adoption_norm) + (wR*Readiness_norm) + (wI* Investment_norm). Priority Rank uses a dense rank on the priority score. High Priority label shows only when the score passes a certain cutoff to cut down on labels.

B) Parameters

- Top N Countries. This lets the user pick the number of countries to show, such as 10. It works in the top or bottom ranking and trend views.
- Top vs Bottom switch. This control shows either top countries or bottom countries based on adoption.
- Adoption threshold. The default is 0.12.
- Readiness threshold. The default is 70.
- Weights for the priority score. Weight for Adoption is 0.45, Readiness is 0.35 and Investment is 0.20. These weights set how much each metric adds to the final priority score.

# 6. VISUALIZATION INSIGHTS AND ANALYSIS

AI Adoption Trends (2021–2025)

The trend chart shows AI adoption rates over years for top countries. Adoption stays close between 2021 and 2023 for many places. It then goes up in 2024 and 2025. Denmark leads each year and hits 42.03% in 2025. This view helps see how fast countries change, not just their end position.

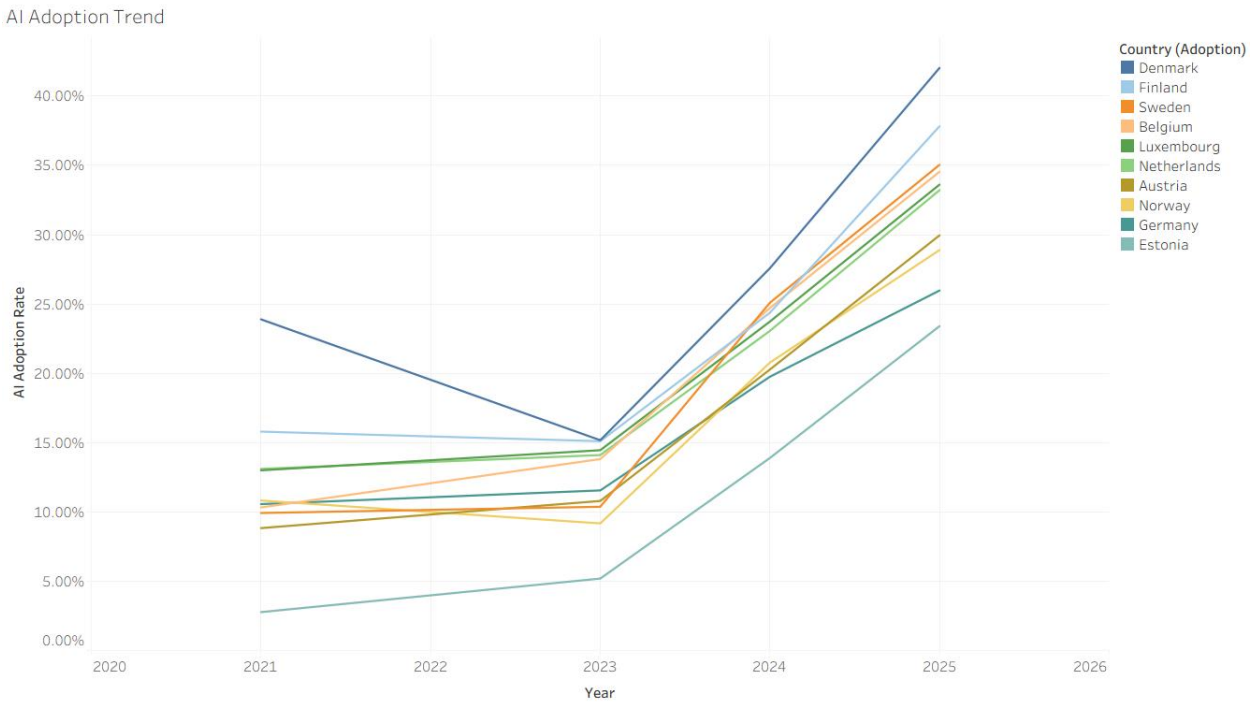

*Figure 1: AI Adoption Trends (2021–2025)*

Top and Bottom Countries by AI Adoption (2025)

The ranking view uses data from 2025. For top 10: Denmark at 42.03%, Finland at 37.82%, Sweden at 35.04%, Belgium at 34.54%, Luxembourg at 33.61%, Netherlands at 33.21%, Austria at 29.95%, Norway at 28.89%, Germany at 25.97%, Estonia at 23.40%. A switch lets users see bottom countries instead.

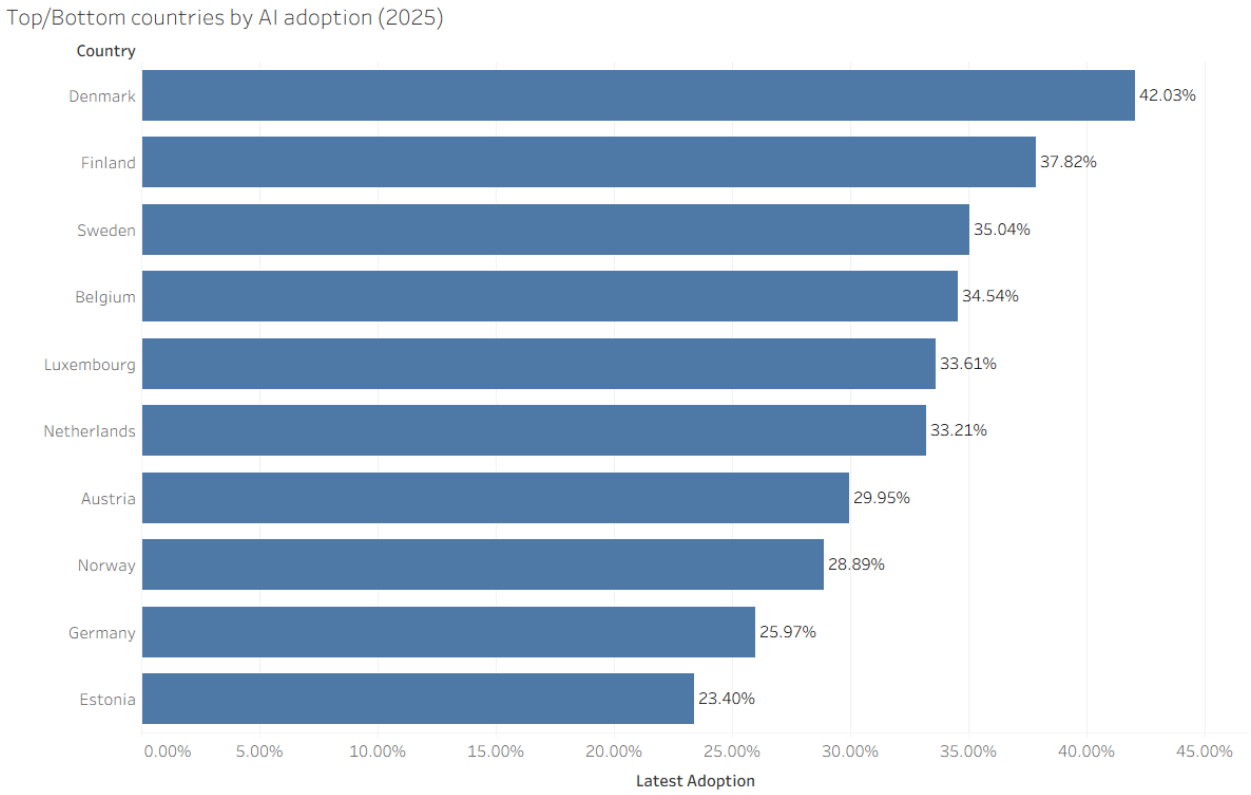

*Figure 2: Top and Bottom Countries by AI Adoption (2025)*

## AI Readiness Map (2023)

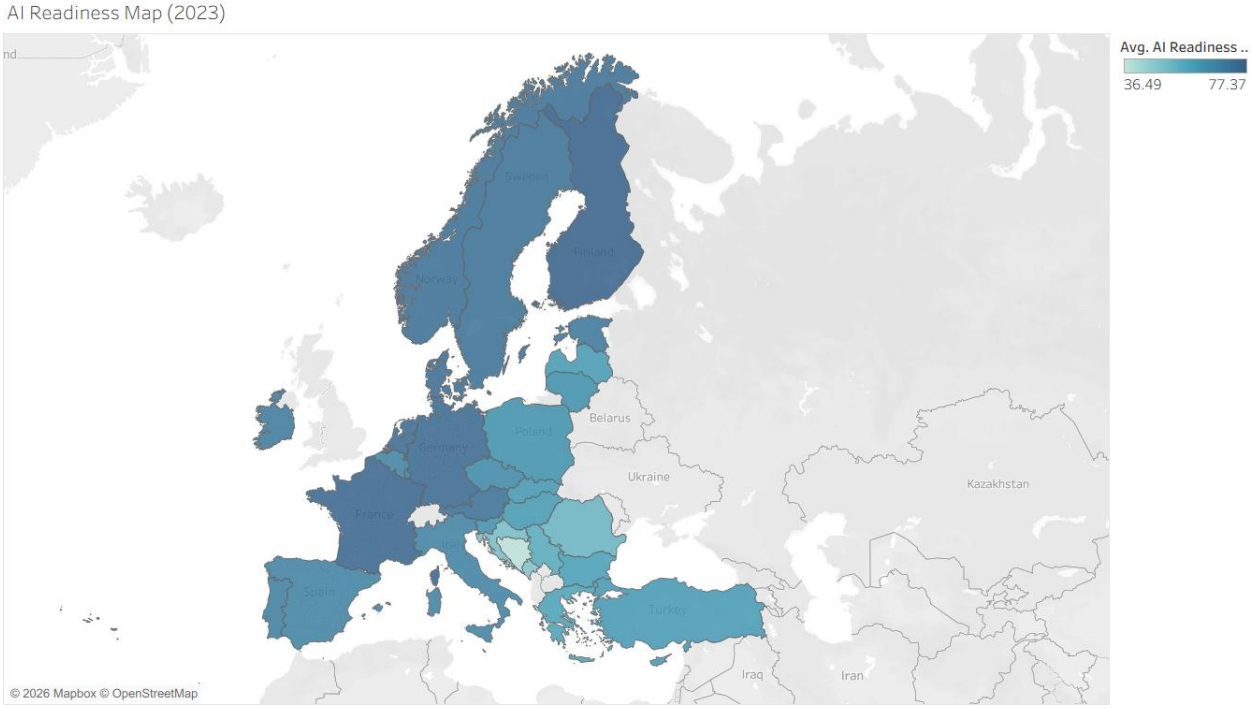

*Figure 3: AI Readiness Map (2023)*

The map uses color to show readiness scores. Scores go from about 36.49 to 77.37. Nordic and Western Europe have higher scores. Eastern and Balkan areas have lower ones. It gives a fast way to compare regions, but only for 2023.

AI VC Investment Trends

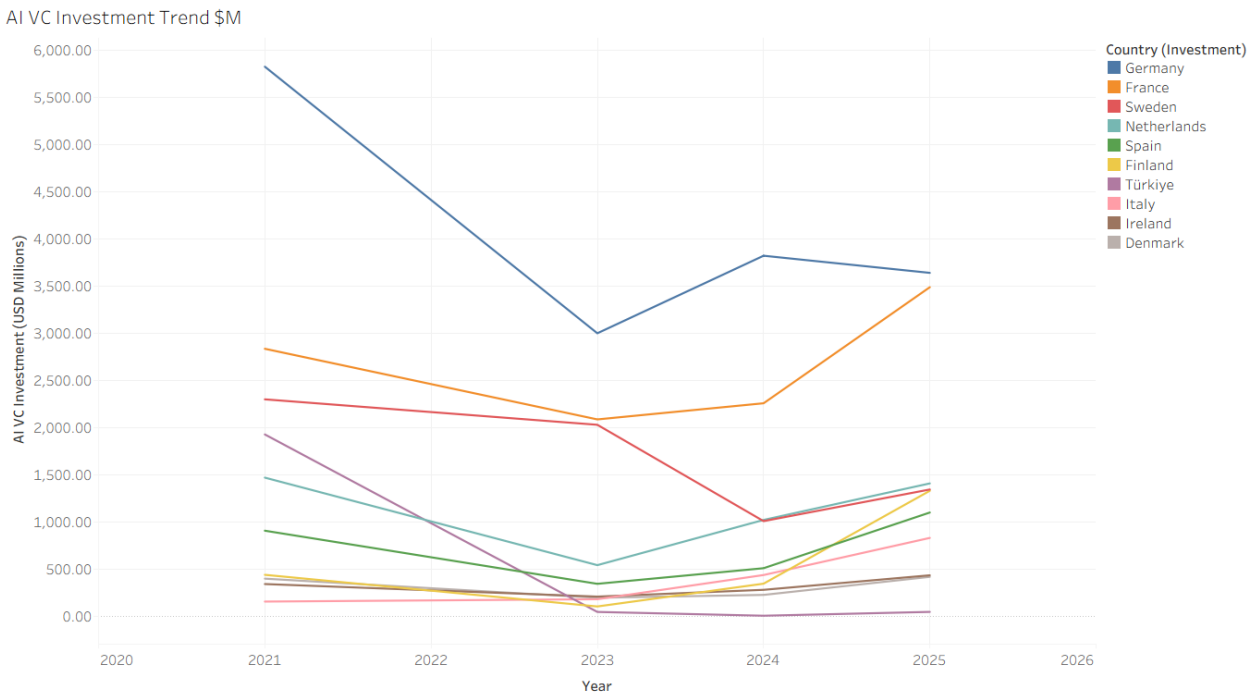

*Figure 4: AI VC Investment Trends*

The line chart tracks investment in millions of USD over time for key countries. Levels change a lot. Many drop near 2023 but go up later. Germany stays high overall. France grows in 2025. Even small countries show shifts from 2023 to 2025.

Opportunity Quadrant (2023)

Thresholds are 70 for readiness and 12% for adoption. Groups are: Scale Now for high in both (Denmark, Finland, Netherlands). Build Demand for high readiness but low adoption (like Germany). De-risk First for high adoption but low readiness (like Luxembourg, Belgium). Monitor for others. Point size shows investment to spot funding in each group.

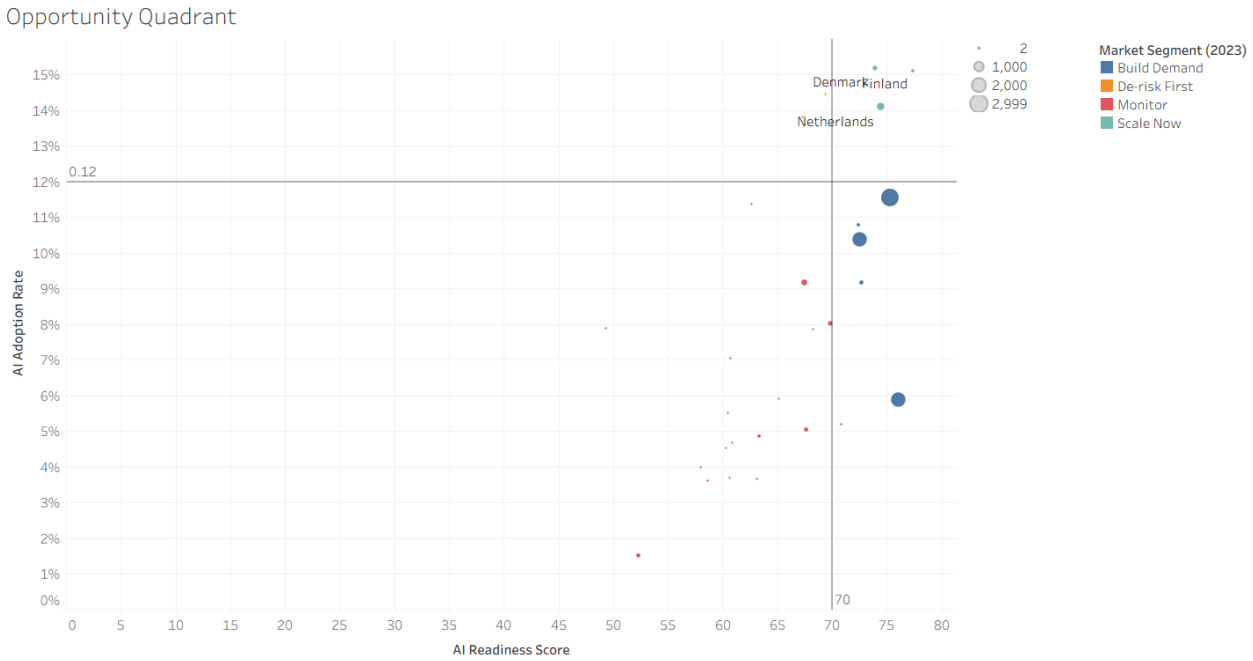

*Figure 5: Opportunity Quadrant (2023)*

Priority Ranking Table (2023)

| Country | Adoption Rate | Readiness Score | VC Investment (USD Millions) | Priority Score | Rank |
|---|---|---|---|---|---|
| Germany | 11.6% | 75.3 | 2,998.99 | 0.86 | 1 |
| Finland | 15.1% | 77.4 | 101.91 | 0.80 | 2 |
| Denmark | 15.2% | 73.9 | 194.05 | 0.78 | 3 |
| Netherlands | 14.1% | 74.5 | 539.96 | 0.78 | 4 |
| Sweden | 10.4% | 72.6 | 2,028.55 | 0.74 | 5 |
| Luxembourg | 14.5% | 69.4 | 19.22 | 0.71 | 6 |
| Belgium | 13.8% | 67.3 | 58.57 | 0.67 | 7 |
| France | 5.9% | 76.1 | 2,085.58 | 0.62 | 8 |
| Austria | 10.8% | 72.4 | 100.17 | 0.62 | 9 |
| Norway | 9.2% | 72.7 | 184.62 | 0.57 | 10 |
| Slovenia | 11.4% | 62.6 | 39.87 | 0.55 | 11 |
| Spain | 9.2% | 67.5 | 342.02 | 0.54 | 12 |
| Ireland | 8.0% | 69.8 | 206.58 | 0.51 | 13 |
| Portugal | 7.9% | 68.3 | 40.38 | 0.48 | 14 |
| Estonia | 5.2% | 70.9 | 27.38 | 0.42 | 15 |

*Figure 6: Priority Ranking Table (2023)*

The table mixes adoption, readiness, and investment. It uses weights to make a score and rank. Top are Germany (rank 1), Finland (2), Denmark (3), Netherlands (4), Sweden (5). Germany tops

due to high readiness and investment, though adoption is under 12%. This aids choices, but depends on weights.

Adoption vs VC Investment (2023)

The scatter plot puts investment on x-axis (log scale) and adoption on y-axis. Trend line rises only at top investment. Points spread out. Luxembourg has high adoption but less investment than Germany or Sweden. Germany and Sweden have high investment but mid adoption. This shows weak link between them in 2023.

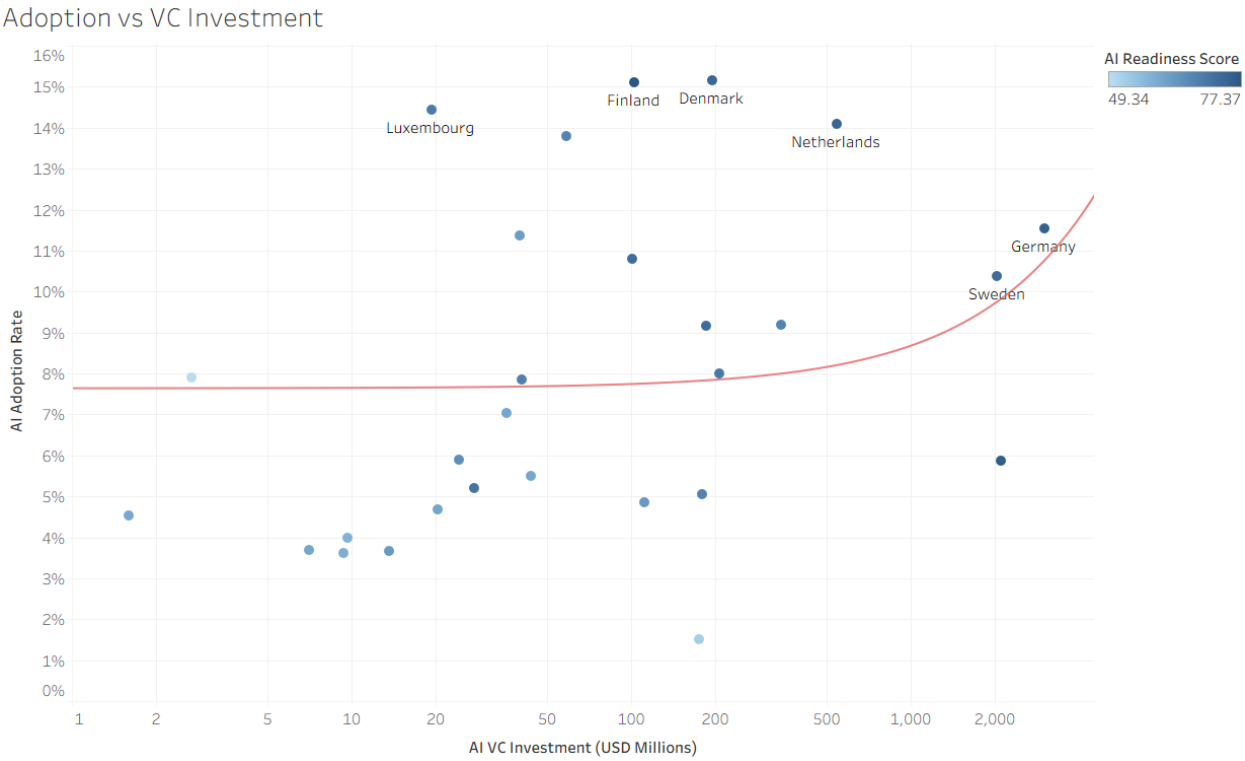

*Figure 7: Adoption vs VC Investment (2023)*

## Dashboard 1: AI Adoption & Investment Overview (2021–2025)

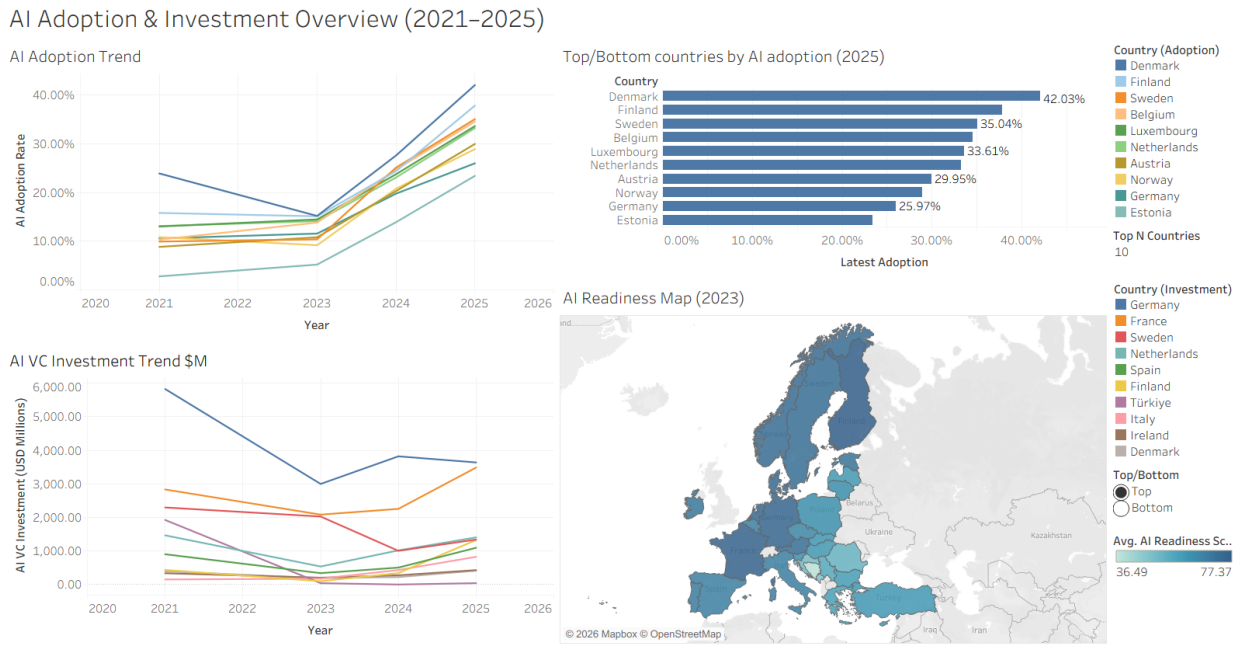

*Figure 8: Dashboard 1: AI Adoption & Investment Overview (2021–2025)*

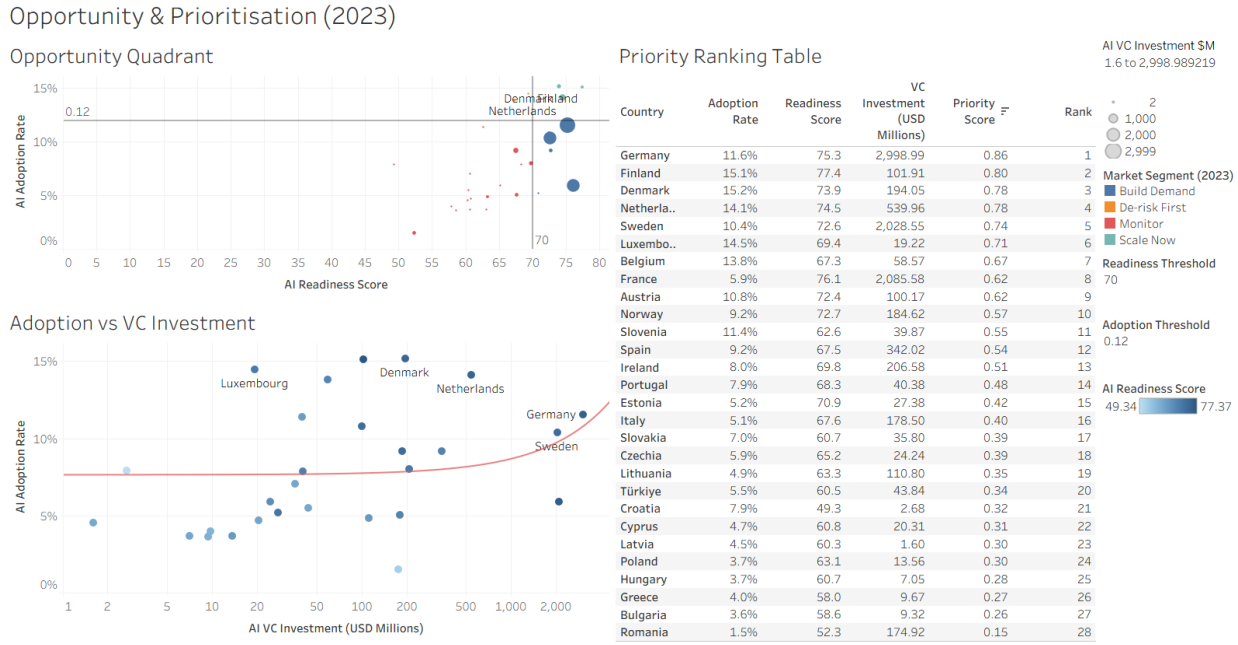
This dashboard joins trend charts for adoption and VC, ranking for adoption, and readiness map. It covers leaders in adoption, changes over time, investment focus, and readiness gaps.

## Dashboard 2: Opportunity & Prioritisation (2023)



| Country | Adoption Rate | Readiness Score | VC Investment (USD Millions) | Priority Score | Rank |
|---|---|---|---|---|---|
| Germany | 11.6% | 75.3 | 2,998.99 | 0.86 | 1 |
| Finland | 15.1% | 77.4 | 101.91 | 0.80 | 2 |
| Denmark | 15.2% | 73.9 | 194.05 | 0.78 | 3 |
| Netherla.. | 14.1% | 74.5 | 539.96 | 0.78 | 4 |
| Sweden | 10.4% | 72.6 | 2,028.55 | 0.74 | 5 |
| Luxembo.. | 14.5% | 69.4 | 19.22 | 0.71 | 6 |
| Belgium | 13.8% | 67.3 | 58.57 | 0.67 | 7 |
| France | 5.9% | 76.1 | 2,085.58 | 0.62 | 8 |
| Austria | 10.8% | 72.4 | 100.17 | 0.62 | 9 |
| Norway | 9.2% | 72.7 | 184.62 | 0.57 | 10 |
| Slovenia | 11.4% | 62.6 | 39.87 | 0.55 | 11 |
| Spain | 9.2% | 67.5 | 342.02 | 0.54 | 12 |
| Ireland | 8.0% | 69.8 | 206.58 | 0.51 | 13 |
| Portugal | 7.9% | 68.3 | 40.38 | 0.48 | 14 |
| Estonia | 5.2% | 70.9 | 27.38 | 0.42 | 15 |
| Italy | 5.1% | 67.6 | 178.50 | 0.40 | 16 |
| Slovakia | 7.0% | 60.7 | 35.80 | 0.39 | 17 |
| Czechia | 5.9% | 65.2 | 24.24 | 0.39 | 18 |
| Lithuania | 4.9% | 63.3 | 110.80 | 0.35 | 19 |
| Türkiye | 5.5% | 60.5 | 43.84 | 0.34 | 20 |
| Croatia | 7.9% | 49.3 | 2.68 | 0.32 | 21 |
| Cyprus | 4.7% | 60.8 | 20.31 | 0.31 | 22 |
| Latvia | 4.5% | 60.3 | 1.60 | 0.30 | 23 |
| Poland | 3.7% | 63.1 | 13.56 | 0.30 | 24 |
| Hungary | 3.7% | 60.7 | 7.05 | 0.28 | 25 |
| Greece | 4.0% | 58.0 | 9.67 | 0.27 | 26 |
| Bulgaria | 3.6% | 58.6 | 9.32 | 0.26 | 27 |
| Romania | 1.5% | 52.3 | 174.92 | 0.15 | 28 |

*Figure 9: Dashboard 2: Opportunity & Prioritisation (2023)*

This has quadrant, scatter, and ranking table. Sliders change thresholds. Investment filter cuts outliers for fair views of small countries.

Overall Analysis

Nordic countries lead adoption and readiness, which points to strong ecosystems. Germany stands out in investment but lags in adoption, so it may need steps to boost use. The low link between investment and adoption means funding alone does not drive quick uptake. Segments help target actions: scale in ready places, build demand where government is set but businesses lag. Dashboards let users explore and adjust for decisions.

# 7. OUTPUT VALIDATION

1) Excel pivot validation (Top countries by AI adoption in 2025)

- The cleaned Eurostat adoption file was opened in Excel.
- A pivot table was created with:
  - Rows: Country
  - Values: AI Adoption Rate (%)
  - Filter: Year = 2025
- The countries were then sorted in descending order.
- The Top 10 list and percentages from the pivot table were compared with the Tableau "Top/Bottom countries by AI adoption (2025)" sheet.
- The ranking and values matched, which confirms that the Latest Adoption % logic and country filtering in Tableau is working as expected.

| Year | 2025 |
|---|---|
| | |
| **Country** | **Average of AI_Adoption_Rate** |
| Denmark | 42.03 |
| Finland | 37.82 |
| Sweden | 35.04 |
| Belgium | 34.54 |
| Luxembourg | 33.61 |
| Netherlands | 33.21 |
| Austria | 29.95 |
| Norway | 28.89 |
| Germany | 25.97 |
| Estonia | 23.40 |

*Figure 10: Excel Pivot Table*

2) Python validation (Adoption vs VC Investment in 2023)

- In Google Colab, the same cleaned adoption and VC investment datasets were loaded.
- Data was aggregated at country level for 2023 to match the Tableau scatter plot.
- A scatter plot was created using:
  - X-axis: AI VC Investment (2023)

- Y-axis: AI Adoption Rate (2023)

- A regression line was added to reproduce the Tableau trend line behaviour.
- The overall pattern was the same as Tableau, showing a weak relationship between adoption and investment for 2023.

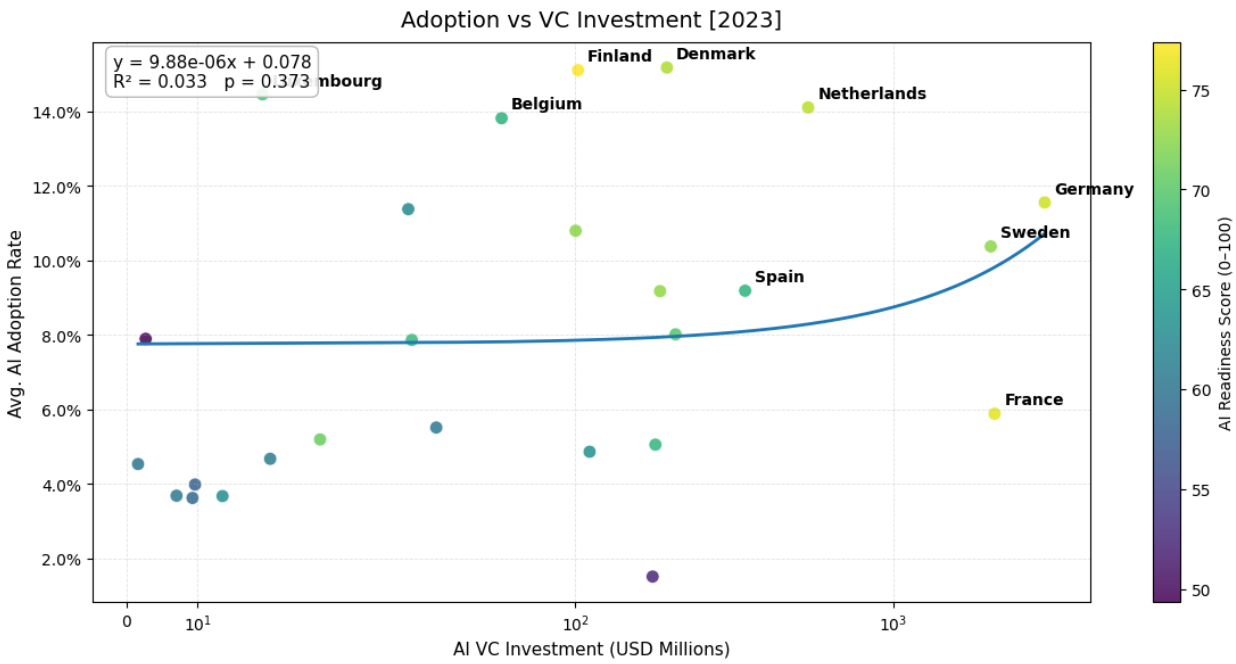


*Figure 11: Python Implemented Adoption vs VC Investment Trend Line (2023)*

# 8. CONCLUSION

This project combined three sources to study AI adoption, AI VC investment, and government AI readiness at country level. The dashboards show that enterprise AI adoption increased from 2021 to 2025 for most countries in the Eurostat data. The rise is very clear after 2023. In 2025, Denmark, Finland, Sweden, Belgium, Luxembourg, and the Netherlands be the highest adoption countries.

The investment data shows that the fundings are concentrated on few countries, especially in Europe and we can also see that it changes a lot based on the year. When adoption and investment are compared for 2023, the scatter plot shows wide spread. And the weak upward pattern suggests that higher VC investment in a country does not translate to higher enterprise adoption , especially in the same year.

The opportunity quadrant and the priority ranking table beautifully helps to make business decisions out of this analysis. With the default thresholds at 12% for adoption rate and readiness score by 70, Denmark, Finland, and the Netherlands fall into the “Scale Now” segment, while Germany, Sweden and France received higher funds they are still not at the mark. The table helps to shortlist the countries for market decisions or discuss policies and measures. Overall, the dashboards provide measures and indicators to structurally compare countries for the AI growth.

# 9. LIMITATIONS

- No causal claim: This analysis is descriptive. A relationship between adoption and investment does not prove cause and effect.
- Readiness is single-year: Oxford readiness is only used for 2023, so readiness trends cannot be analysed across time.
- Different coverage across datasets: Eurostat mainly covers Europe and includes EU aggregates, while Oxford is global and OECD coverage varies. This reduces full comparability.
- Time gaps in adoption: The Eurostat extract used here does not include every year (for example, 2022 is missing), so the trend line has fewer points.
- Industry detail not aligned: OECD investment is available by industry in raw form, but this project uses a country-year total. This reduces sector-level insight.
- Investment values can be skewed: A few large deals can dominate totals, so some country comparisons can be driven by outliers.
- Priority score depends on choices: The ranking changes if the user changes weights or thresholds, so it should be treated as a planning tool, not a final judgement.

# APPENDIX

This report is supported by additional working files. These files contain the cleaned datasets, validation outputs, and the Tableau workbook used to build the charts and dashboards. They are provided separately as evidence of the analysis process.

A. Raw source extracts

- eurostat_ai_adoption_raw.xlsx
  - Original Eurostat data before cleaning.
- oecd_vc_ai.zip
  - Original OECD VC investment files downloaded separately before consolidation.
- oxford_ai_readiness_raw.xlsx
  - Original Oxford Insights (2023) extract before filtering to overall score.

B. Tableau workbook

- AI Trends.twb
- Contains all worksheets, dashboards, calculated fields, parameters, and relationships used in this project.

C. Cleaned datasets (used in Tableau)

- eurostat_ai_adoption_clean.xlsx
  - Final adoption dataset (enterprises with 10+ employees).
- oecd_ai_vc_investment_clean.xlsx
  - Final VC investment dataset aggregated to country-year, including the count of contributing industries.
- oxford_ai_readiness_2023_clean.xlsx
  - Final readiness dataset (overall score only).

D. Validation artefacts

- Pivot Table - Top countries by AI adoption (2025).xlsx
  - Excel pivot used to validate the 2025 adoption ranking shown in Tableau.
- Python - Adoption_vs_VC_Investment_(2023).ipynb
  - Colab notebook used to replicate the 2023 adoption vs VC investment scatter and trend line outside Tableau.

E. How to access

All appendix files are shared along with the report submission in this drive – Google Drive.
